MITEARREST

Nobody wants them, but if need to treat, we have the answer.....

- Fur mites on laboratory rodents present a dangerous and sometimes deadly threat. **MITEARREST®** is an insecticidal bedding developed at Harvard University for the control and prevention of invasive acarids. **MITEARREST®** is the easiest to use, most effective and least expensive option available to eradicate fur mites.
- **MITEARREST®** enlists the natural nesting instincts of lab rodents to deliver a potent yet safe acaricide to the fur of the animal. When added to standard bedding material, **MITEARREST®** is readily accepted by the rodents and quickly turned into nests. Existing mites are killed through constant contact with the treated bedding and **MITEARREST®** will kill new mites as they hatch from their eggs.

Based on the proven technology of **Damminix®** Tick Tubes, **MITEARREST®** is:

- **Safe and effective** – even in cases of sever infestations
- **A Valuable Time Saver** for animal technicians
- **Easy to Use** – no time consuming dips, dusts or injections.
- **Readily Accepted** by rodents for nesting material
- Known to **Reduce Handling Stress** for lab animals
